MODULE *FarmerCrossesRiver*

---

EXTENDS *Integers, FiniteSets*

A farmer stands in front of a large river. It has no bridge. There is a fence on the other side.

He wants to bring over a wolf, a goat and a cabbage in his rowing boat. But he can only take one thing per trip!

ATTENTION: If the farmer is absent, the wolf can eat the goat and the goat can eat the cabbage.

VARIABLES *carriage\_on\_side, boat, boat\_side, last\_carriage*

*vars*  $\triangleq \langle \textit{carriage\_on\_side}, \textit{boat}, \textit{boat\_side}, \textit{last\_carriage} \rangle$

*BoatIsEmpty*  $\triangleq \text{Cardinality}(\textit{boat}) = 0$

*BoatIsLoaded*  $\triangleq \text{Cardinality}(\textit{boat}) = 1$

$ThisSideCarriage \triangleq carriage\_on\_side[boat\_side]$

---

$UpdateCarriageStatus(new\_this\_side) \triangleq$

I would love to write something like this, but do not know how to use  
variable as string value for key in struct, *TLC* module *toString* does not help

```

LET not_boat_side  $\triangleq$  OtherSide(boat_side)
IN  carriage_on_side' = [boat_side  $\mapsto$  new_this_side, not_boat_side  $\mapsto$  carriage_on_side["end"]]
IF boat_side = "start"
  THEN carriage_on_side' = [start  $\mapsto$  new_this_side, end  $\mapsto$  carriage_on_side["end"]]
  ELSE carriage_on_side' = [end  $\mapsto$  new_this_side, start  $\mapsto$  carriage_on_side["start"]]

```

$UpdateBoatIfSafe(new\_this\_side, new\_boat) \triangleq$

```

 $\wedge$  Safe(new_this_side)
 $\wedge$  boat' = new_boat
 $\wedge$  UNCHANGED boat_side
 $\wedge$  UpdateCarriageStatus(new_this_side)

```

---

$ChangeBoatContent(participant) \triangleq$

```

 $\wedge$  participant  $\neq$  last_carriage
 $\wedge$  LET new_this_side  $\triangleq$  (ThisSideCarriage  $\setminus$  {participant})  $\cup$  boat
    new_boat  $\triangleq$  {participant}
IN   $\wedge$  last_carriage' = participant
     $\wedge$  UpdateBoatIfSafe(new_this_side, new_boat)

```

$UnloadBoat \triangleq$

```

 $\wedge$  BoatIsLoaded
 $\wedge$  LET new_this_side  $\triangleq$  ThisSideCarriage  $\cup$  boat
    new_boat  $\triangleq$  {}
IN   $\wedge$  last_carriage' = last_carriage
     $\wedge$  UpdateBoatIfSafe(new_this_side, new_boat)

```

$RowOverToOtherSide \triangleq$

```

 $\wedge$  boat_side' = OtherSide(boat_side)
 $\wedge$  UNCHANGED  $\langle carriage\_on\_side, boat, last\_carriage \rangle$ 

```

$Transport \triangleq$

```

 $\vee \exists participant \in ThisSideCarriage : ChangeBoatContent(participant)$ 
 $\vee$  UnloadBoat
 $\vee$  RowOverToOtherSide

```

---

$Next \triangleq Consistent \wedge Transport$

$$Spec \triangleq Init \wedge \square[Next]_{vars}$$

THEOREM  $Spec \Rightarrow \square TypeOK$

---

Ensure we get a *Stacktrace* containing the Solution, set this as Invariant  
 $NoSolution \triangleq Cardinality(carriage\_on\_side["end"]) < 3$
